

AMCO Harvest Dashboards

The **AMCO Harvest Dashboard** is a productivity and automation accelerator designed to streamline how OneStream Administrators process OneStream workflow imports.

Instead of loading data files **one at a time** for each Entity, Scenario, and Time combination, the dashboard enables users to **process multiple imports in a single run**—saving significant administrative time and reducing operational bottlenecks.

Beyond batch processing, the dashboard also allows users to **reprocess previously loaded files without re-importing them**, giving finance teams more flexibility, better control, and less dependence on manual file handling.

Challenges This Solution Addresses

1

Time-consuming, repetitive file loading

Traditionally, workflow imports must be executed **file by file**, forcing administrators to repeat the same steps across Entities, Scenarios, and Periods.

AMCO Harvest addresses this by:

- ✓ Allowing **multi-file, multi-dimension processing** in one action.
- ✓ Reducing manual workload and the risk of skipped imports.

2

Reprocessing requires re-importing

If data needs to be revalidated, reloaded, or recalculated, users typically must **locate and re-import the same file**, which is inefficient and prone to errors.

The dashboard solves this by:

- ✓ Allowing users to **reprocess previously loaded files** with a single command.
- ✓ Eliminating the need to find, reload, or manually manage original files.

3

3. Lack of transparency and control across workflow imports

When imports are done one at a time, tracking what was processed and when can be unclear, making it harder to manage auditability and consistency.

AMCO Harvest improves this by:

- ✓ Providing a **centralized dashboard** that shows all processed imports.
- ✓ Creating a more controlled, structured workflow for managing data loads.
